

We are an ambitious startup focused on the design and delivery of Digital Brains. Starting from finance and cybersecurity where we are already working along different tier one companies.

As professionals we have quite a robust background on disruptive digitization and we want that to be the case also going forward. Hence, not only are we focused on the usage of scientific techniques such those within A.I. but also new technologies such as blockchain.

At the current stage we want to provide our clients with a myriad of proofs of value (POVs) and that is why we will be considering for the first time interns. Not only will they be involved in our cutting edge projects but also this will serve as a filter of talent for us to **hire new employees** going forward.

We want smart students looking forward to realistically engage into the unlock of innovation. This means both **talent and humbleness** (with the people, the project, etc). Along with machine learning knowledge we require you to feel very comfortable with Python and OO programming.

Starting: 1st-15th December. Deadline: 10th December. Duration will be rolled-over in slots of 3 months (5h/day, some days in remote) dependent on how we all (team-approach) succeed on those POVs.

Check us out (curiosity is a must in SciTheWorld) and decide whether we are the type of talent you want to be close to.

Simply drop an email to info@scitheworld.com with a short presentation. We will be contacting you.
